

## Shredder EWS 20 DK

The shredder EWS 20 DK has a „one-roll-gashed-cutter“ in double-head execution. It can crush material in right-handed rotation as well as in left-handed rotation. The main range of application is the shredding of synthetic material, wood, paper, punchings, etc. By means of the bidirectional cut, the process and cutting process will be optimised and a secure function will be guaranteed. A reswitched sieve analyzes the grade of quality (grade of grain) of the material. In the presented example of application, plastic chips will be cut which appear in an operating process and will be collected with the cooling liquid in the drum situated thereunder and afterwards, the chips will be thrown off in a chip centrifuge. The liquid flows back into the processing machine and the granulated chips will be supplied to a subsequent processing.
